SUMMARY

Software engineer with a production-deployed application, 95%+ test coverage, and CI/CD via GitHub Actions, Docker, and Kamal 2. Completing an AAS in Software Design, June 2026.

SKILLS

Languages: Ruby, JavaScript, PowerShell, SQL, HTML5, CSS3

Frameworks and Libraries: Ruby on Rails, Hotwire (Turbo / Stimulus), RubyLLM

Databases and APIs: PostgreSQL, RESTful API design, ActiveRecord

DevOps and Infrastructure: Docker, GitHub Actions, Kamal 2, DigitalOcean, Linux, Git

Testing and Architecture: TDD, Minitest, RSpec, Brakeman, service-layer architecture, MVC, OOP

PROJECT EXPERIENCE

Pangu Terminal · *Rails 8 · Hotwire · PostgreSQL · Docker · Kamal 2 · GitHub Actions*

panguterminal.ambalong.dev · github.com/jambalong/pangu-terminal

- Shipped and actively maintain a production Rails 8 application with all five proposal features, 95%+ test coverage, and CI/CD via GitHub Actions running on every pull request.
- Built a service layer encapsulating game rules across sourced drop rate tables, decoupling business logic from controllers and keeping each feature independently testable.
- Designed a stateless REST API across seven versioned endpoints authenticated with SHA-256 hashed bearer tokens and per-key rate limiting, eliminating session management for third-party clients.
- Used Turbo Streams to scope inventory re-renders to the edited item and its synthesis group, avoiding full-page reloads on every quantity change without adding a client-side framework.
- Built a Waveplate Optimizer that aggregates deficits across all active plans and ranks dungeon sources by material breadth, replacing manual cross-referencing with a single prioritized farming order.
- Integrated RubyLLM to generate farming recommendations, injecting live reconciliation and synthesis data as structured context to produce per-plan plain-language advice.

EFI Boot Manager Certificate Compliance Script · *PowerShell · ManageEngine*

github.com/jambalong/efi-bootmgr-cert-check

- Built a PowerShell compliance script and deployed it across multiple departments via ManageEngine Endpoint Central that mounts the EFI system partition at runtime, reads the boot manager's signing certificate, and writes per-machine compliance records to a UNC share.
- Identified that Get-AuthenticodeSignature and Get-PfxCertificate return incorrect issuer data for EFI binaries, traced it to a known PowerShell bug, and resolved it by switching to X509Certificate.CreateFromSignedFile.

EXPERIENCE

Information Technology Intern

Jan 2025 – Present

Walla Walla Community College

- Audited 600+ technology assets across 65+ classrooms and campus facilities, producing accurate departmental inventory records.
- Analyzed lab usage data against term calendars, college closures, and scheduled events to produce summary reports informing leadership resource planning.
- Reimaged 60+ computers annually, restoring devices to deployment standard and returning equipment to full academic service within the same term.
- Wiped 100+ decommissioned machines and removed drives to meet data security compliance requirements before equipment left campus.

EDUCATION

AAS in Software Design

Expected June 2026

Walla Walla Community College
